

CAN Adapters: I've updated the driver of my USB-CAN, but the alias baudrate 2400 is not functioning anymore?

There is a VBScript in the driver package, which must be called for each installed virtual USB-CAN COM port:

```
cscript regmodify.vbs COM<x>
```

Replug the USB-CAN! Then you can open the port with any standard baudrate - **except 115kbps!**

Take also a look at the [last manual](#) .
